Data Request for a Thesis Study

Aquaplus Water Refilling Station, San Juan City

Group Statisfied, CS0025 Thesis, TS31

We are four Computer Science students working on our thesis under the guidance of our adviser. Our thesis needs a real business that is willing to share its records. This sheet lists exactly which records we would ask from the station, so the owner can see right away what is needed and what is not.

What We Would Like To Study

We want to use the station's own sales and delivery records to forecast how many refills and deliveries to expect each day and week, and to list regular customers who have stopped ordering so the owner can follow up. The forecast would help plan stock, staff and delivery trips.

The Records We Are Asking For

The first row of each table is the one we need most. The others help the study but are optional.

Record	What Each Entry Should Show	Why We Need It
Sales and delivery log (most needed)	One line per sale or delivery order. Date, and time if recorded. Walk-in, pick-up or delivery. Product and size (for example 5-gallon refill, new container). Quantity. Price. Payment type. Customer name, or a code or "regular" or "walk-in". For deliveries, only the barangay.	This is the main data. The forecast is built from it.
Regular customer list	One line per regular customer. A code or name, the date of the first order, household or business, and the barangay. Whether the customer is on a fixed delivery schedule.	To spot customers who stop ordering.
Price and promo changes	The date of each price change or promo, the product, and the old and new price.	Prices and promos change demand.
Days the station was closed or limited	Dates of closures, water or power interruptions, shorter hours, and the start date of delivery service or any new branch.	Explains days with unusually low or high sales.
Capacity facts (a short note)	Refills the station can do in a day, and the number of delivery riders or trips per day.	To keep the forecast realistic.

Period and Size

From January 2021 up to today, as far back as the records go. Our school asks for at least 5,000 records from 2021 onward. For example, about 15 orders a day over one year is already about 5,000 records, so a record of each sale is enough. Monthly totals alone are not enough, because we need to see each day.

Format

Excel or CSV is best. If the records are in a notebook or logbook, clear photos of the pages are fine, and we will do the typing ourselves with the owner's permission.

Privacy

- We do not need customer phone numbers or home addresses. Names are optional and we replace them with codes before anyone in the group analyzes the data.
- We follow the Data Privacy Act of 2012 (Republic Act No. 10173).
- The records are used only for this thesis, with the owner's written permission, and are kept private. We can delete them after the thesis if the owner wishes.
- The station's name can be hidden in the final paper if the owner prefers.

What You Get Back

A simple dashboard with the expected demand for the coming weeks, a planning guide for stock and deliveries, and the list of regular customers to follow up. The group would present it to the owner.

Three Questions To Answer First

1. Do you record each sale or delivery? On paper, in an app or in a spreadsheet?
2. Since which year do you have these records, and about how many orders do you get in a day?
3. Do you track customers by name or address, and is it fine if we replace them with codes?
