

Technical 2: Android Activity Lifecycle

Lifecycle Observation Report

Application Overview

The app has one Activity, MainActivity, that overrides all seven lifecycle callbacks: onCreate(), onStart(), onResume(), onPause(), onStop(), onRestart() and onDestroy(). Each callback calls Log.d() with the tag PamesaLifecycle and the message Dawn Andrei Pamesa is calling <method>(), so all messages can be filtered in Logcat with tag:PamesaLifecycle. A Finish Activity button calls finish() so that onDestroy() can be triggered on purpose. The app was tested on the Pixel 10 Pro emulator.

Figure 1. The app in portrait and landscape.

Observation Table

#	Action Performed	Callback Sequence Observed	Explanation
1	Launch the app	onCreate() → onStart() → onResume()	The system creates the Activity, makes it visible, then brings it to the foreground so the user can interact with it.
2	Press Home	onPause() → onStop()	The Activity loses focus first (onPause), then is fully hidden by the home screen (onStop). It stays in memory, so it is not destroyed.

3	Reopen the app	onRestart() → onStart() → onResume()	The Activity was only stopped, so it comes back through onRestart() instead of onCreate(), then becomes visible and interactive again.
4	Switch to another app (Settings)	onPause() → onStop()	Settings covers the whole screen, so the Activity is paused and then stopped, the same as pressing Home.
5	Switch back to the app	onRestart() → onStart() → onResume()	The stopped Activity is brought back to the front, so it restarts, starts and resumes without being created again.
6	Rotate the device to landscape	onPause() → onStop() → onDestroy() → onCreate() → onStart() → onResume()	Rotation is a configuration change. By default Android destroys the Activity and creates a new one so the layout reloads for the new orientation. Rotating back to portrait produced the same six callbacks.
7	Press Back	onPause() → onStop() → onDestroy()	Back tells the system the user is done with this screen, so the Activity is paused, stopped and destroyed. The process stayed alive (same PID 6229).
8	Launch the app again	onCreate() → onStart() → onResume()	The previous Activity was destroyed, so a brand new one starts with onCreate() instead of onRestart().
9	Tap the Finish Activity button	onPause() → onStop() → onDestroy()	finish() ends the Activity on purpose, so onDestroy() is guaranteed to run here, unlike when the system kills the process.

Logcat Evidence

Each figure shows the Logcat messages produced by one action, filtered by the PamesaLifecycle tag. All seven callbacks appear across the figures: onRestart() in Figures 4 and 6, and onDestroy() in Figures 7, 8 and 10.

10-04 05:32:01.509 6229 6229 D PamesaLifecycle: Dawn Andrei Pamesa is calling onStop()
10-04 05:32:01.510 6229 6229 D PamesaLifecycle: Dawn Andrei Pamesa is calling onDestroy()
```

Conclusion

The Activity lifecycle follows a fixed order. Opening an Activity always runs onCreate(), onStart() and onResume(), and leaving it always runs onPause() before onStop(). Whether

the Activity comes back through `onRestart()` or `onCreate()` depends on whether it was only stopped or fully destroyed: Home and switching apps only stop it, while Back, `finish()` and rotation destroy it. Rotation was the most surprising result, because the same screen is destroyed and rebuilt, which means any data not saved would be lost. Since Android does not guarantee `onDestroy()` when it kills the process, important data should be saved in `onPause()` or `onStop()` instead of waiting for `onDestroy()`.
